Customer Reviews

Well I bought this package of really ineffective toilet paper back in 2011. Finally got around to reading it. And since that's several hours of my life I'll never get back, I highly recommend you save yourself that time (and money) and skip this book. It's a poorly edited and organized collection of information gleaned from other sources, all brought together in far too short a format to really even begin to give the subject matter proper treatment. It lacks the comprehensive picture a longer book

would give, while simultaneously lacking the accessibility and simplicity a shorter book should have. It's utterly useless. It would be better to spend more for a real book on hydroponics (I recommend "Hydroponic Food Production" by Howard Resh if you want a really comprehensive book) or simply use the Internet to answer specific questions and learn more organically. The most good Integral Hydroponics would be for growing plants would be to shred it and add it to a compost heap.

This book covers all the basics and more for indoor gardening. He puts complicated plant science into layman's terms so even the least experienced grower can understand. By the time you are done reading this book you will be a pro at understanding how indoor grow rooms function. This way you can be educated when deciding what grow style is going to suit your needs. If you are into hydroponic gardening I highly recommend following him on his site manicbotanix.com. He runs lab analysis on many hydroponic products and calls out the good, the bad, and the down right ugly! This has become my new grow bible FOR SURE. Anyone who writes negative comments are confused by the crap teachings they have learned and haven't taken the time to learn the true science. Great work G!

This book I found amazing. I have worked in the hydroponics industry for some time now, and this book has taught me so many quite often overlooked simple things than end up being many growers peril. The book being written by an Australian really helps me learn things for the climate down here, re heat / humidity and so forth. His methods are simple :_ run to waste Coco medium is my personal favourite also. A great book for beginners and still really good for those a little more advanced in the subject. A newer revised edition is coming out soon which has many recipes on how to make your own quality hydroponic nutrients. This editions contains some growth hormone recipes for paclobutrazol and others which are not really a good thing due to possible carcinogens, but used correctly give you great chunky results. AKA most of the stuff in Australia from South Australia :) All in all just buy this book and read and enjoy like I did and still am.

This is The best book I have read on hydroponics so far. The author breaks down what every grower needs to know, rather than what they think they need. Correct environmental conditions are rightfully stressed, and nutrients are explained shrewdly. This book also details many different systems as well as all the variables that go with them, and explains the pros/cons of each. This book is a handy resource for any serious grower to have on hand.

You definitely want accurate hydroponics growing information because high-value crops like medical marijuana can't be grown using regular fertilizers and methods. Today's hydroponics world offers you a lot of opportunities to push marijuana plants to larger and more stony yields. Unfortunately this book is by a guy who is a legend in his own mind. His book is full of bizarre theories that are his and his only, and that are likely to destroy your crops. The guy is a Luddite who wants people to believe that they can be chemists and fertilizer makers. I recommend you stick with grow books by real gurus and experts like Jorge Cervantes and Ed Rosenthal. This blunder from down under is Aussie macho at its worst.

Took several weeks to send the book, by the time I got it I had already read several other books that go into much greater detail on the subject. Thanks for nothing ...
