Understanding LED Illumination

Synopsis

Understanding LED Illumination elucidates the science of lighting for light emitting diodes. It presents concepts, theory, simulations, and new design techniques that shine the spotlight on illumination, energy efficiency, and reducing electrical power consumption. The text provides an introduction to the fundamentals of LED lamp design, and highlights the principles of large-space and 3D object illumination for developing competitive LED lamps. The first part of the book discusses lamp output metrics and characterization methods, while the second part of the book explores certain retail and prototype lamp comparisons with theory, simulations and experiments. It details the light propagation and distribution characteristics of LED light sources for general illumination applications, and presents design and simulation requirements for LED lamps suited for real-world applications. It also addresses light generation, efficiency, theoretical limits, efficiency limiting factors, and LED lamp design elements. Emphasizes the lighting aspects for LED lamps: quality and improvement. Describes the basics of junction diode and the intricacies of compound semiconductor optoelectronic properties including the thermal, electrical, optical, and mechanical aspects. Explains the challenges of LED lighting in scientific and mathematical terms. Includes case studies from Osram Optosemiconductors, Sylvania, and Phillips, GE, and others. The book characterizes several LED replacement lamps for household and commercial lighting and discusses a novel design for improving tubular LED replacements. It takes the mysteries out of solid-state lighting for lighting designers, and helps LED scientists and engineers effectively design their products to provide high-quality illumination.

M. Nisa Khan received her bachelor's degree in physics and mathematics from Macalester College, St. Paul, Minnesota, and her master's and PhD degrees in electrical engineering from the University of Minnesota, Minneapolis. In 2006, she started an independent research and engineering company in LED lighting and has been involved in innovation and technology development for making solid-state lighting more suitable for general lighting. Dr. Khan performs feasibility studies for LED lighting used in entertainment and signage industries and offers platform design and development solutions for general lighting applications. Since 2007, she has been writing the "LED Update" column for Signs of the Times magazine.

Very comprehensive. Gives the background needed to work with LEDs. Handbook.

It is a good introduction book for LED technology. If you do not have any experience or you are a beginner for LED design, it is good to you.

Very useful in providing the basic principles of LED lighting.

The book provides a complete overview of the LED technology that is at the heart of the new lighting systems and introduces to LED lamp design with a clear and comprehensive description. The text starts with an introduction on lighting fundamentals, on the basics of Light Emitting Diodes and on the characterization methods, then the core of the work is focused on the important aspects one has to consider in order to develop efficient LED lamps with a suitable design. The last three chapters present extensive considerations, simulations and examples on LED lighting design which suit the various applications requirements. Advantages, disadvantages and bottlenecks of LED technology are described with a practical approach, showing also that Solid State Lighting has some inherent limitations to be resolved or addressed before it can become the dominant technology in general lighting. The book is a great, easy to read, guide for engineers, designers, architects and lighting professionals: it helps them to focus the real issues and to design products with high quality performances and suitable for specific applications. In particular very useful suggestions are provided on important topics, such as:

- how to optimize important

parameters to create efficient light sources – how to use the characteristics of light distribution from LED devices in order to satisfy the lighting requirements of common applications that typically need illumination over broad angular ranges. -Dr. Alessio Corazza, Head of Light Sources Laboratory, SAES Getters S.p.A (Italy), review for EPIC European Photonics Industry Consortium

A fairly technical book, but still written to be accessible to those who are not lighting engineers. I learned a lot about the advantages and disadvantages of LEDs, and now understand why they are not sweeping away incandescents and CFLs. Read it now, as I am sure it will go out of date soon!
